## Kimden LED High Bright Lamps

- The high bright LED provides brightness equal to that of incandescent lamps.
- Efficient power source conserves from 0.3 - 0.5W of energy.
- Long lasting lamps greatly reduce maintenance.
- Wide variety of base shapes available.
- Can be used directly with rated voltage because all standard lamps are equipped with internal resistors.
- A wider operating voltage due to a new CV system which combines rated voltage and current control ( instead of using a conventional resistor ).
- Current is not influenced by changes in the supply voltage of ambient temperature.
- With the small LE-6.5D, 9SD, 10D and 10D CV systems.

200/220V AC/DC power sources can be used without the need for transformers or resistors when using the small LE-6.5D, 9SD, 10B and 10D CV systems.
